

C++ I.

Training LAB.

Create a lab report for the following programming challenge.

Running the Race

Write a program that asks for the names of three runners and the time it took each of them to finish a race. The program should display who came first, second, and third place.

Input Validation: Only accept positive numbers for the times.

Additional Requirements:

- The program must be modularized as much as possible.
- Ask ChatGPT for the Functional Requirements of this problem statement. Implement the given or propose functions. This will modularize your program up to an acceptable point.
- Email me one RunningRace.cpp (text file: **read below**) file. Today before 9: PM. Late submission of this programming challenge is not allowed.
- Run your program several times and submit a basic report, only the inputs and the respective outputs. If you want, you can use loops.

Special Instruction: Once you verify that your program or solution is compiling, running and requirements are met. Copy your cpp file in a text file. (open your notepad++) save the text as running.txt and submit this file along with the PDF short lab report as attachment to my email.

Failure to comply with these requirements will result in points taken off.

Any questions? Just email me.
